

Analytic soft gain preserves every direction

Larger second-moment eigenvalues receive larger gain; no direction is zeroed.

Native K/V gradient second moment; curves are not measured model spectra.

$$s_\tau(\mu) = \frac{1}{1 + \tau(1 - \mu)}$$

$$\mu = \lambda / \lambda_{\max}$$

Default: $\tau = 1$

Gain range: $[\frac{1}{2}, 1]$

Full-rank transform
